<sup>\*</sup>PSF Fluids are linear Polydimethylsiloxane fluids

Polydimethylsiloxane Fluids and Phenyl Class fluids have excellent dielectric properties, which are only minimally affected by factors such as temperature and frequency variations. The dielectric strength of silicone fluids is particularly high compared to mineral oil-based oils. However, as with any oil, the dielectric performance of silicone fluids is greatly affected by the quantity of absorbed moisture. The quantity of moisture absorbed is determined by the relative humidity of the atmosphere. Generally, silicone fluids absorb between 100 to 200 ppm.

For high voltage transformer applications, we recommend the STO-50 Silicone Transformer Oil. This fluid is a 100% polydimethylsiloxane that is formulated to contain <50ppm water content and approved for use in electrical transformers.
